1.0 INTRODUCTION

Tests were conducted on a 2005 Chevrolet Equinox FWD LT, 4-Door Liftback MPV, manufactured by General Motors Corporation, to determine compliance with FMVSS 135 "Passenger Car Brake Systems." All tests were conducted in accordance with the U.S. D.O.T., NHTSA Laboratory Procedure TP 135-00 and/or the corresponding TRC Inc. Test Procedure that was submitted to NHTSA for their approval. The test procedure was clearly described in the submitted document and has not been repeated in this report.

All stops were performed manually.

All tests were conducted by TRC Inc. personnel using the following TRC facilities:

7.5-Mile Test Track

Vehicle Maximum Speed

Burnish

Heating Snubs and Hot Performance Stops

Brake Cooling and Recovery Stops

Skid Pad

Cold Effectiveness Stops

High Speed Effectiveness Stops

Stops with Engine Off

Failed Antilocks

Failed Variable Proportioning Valve (if applicable)

Failed Hydraulic Circuits

Brake Power Assist Unit Failures

RBS Failure

EMF (Battery) Failure

Brake Slope

Parking Brake

Average PFC during the test period was 0.99 (Skid Pad) and 0.95 (Test Track) utilizing the ASTM E1337 w/E1336 tire method.

The test vehicle was ABS equipped. Therefore, the Wheel Lock Sequence and Adhesion Utilization Tests were not performed.

This vehicle met the requirements of FMVSS 135.

Shall have a capacity at least equal to fluid displacement required to charge the system pistons on accumulators to normal operating pressure <u>plus</u> displacement when wheel cylinders or caliper pistons move from new lining to full worn condition as above.	NA	
Reservoir Labeling (S5.4.3)				
Exact copy of reservoir label: On master cylinder reservoir cap and top of reservoir: <u>WARNING.</u> <u>CLEAN FILLER CAP BEFORE REMOVING.</u> On top of reservoir: <u>USE ONLY DOT 3 BRAKE FLUID FROM A SEALED CONTAINER.</u>		Label shall read: "Warning, clean filler cap before removing; use only * fluid from a sealed container". * Fluid type specified in 49 CFR 571.116	X	
Measure letter height	3.2 mm	Letters shall be at least 3.2 mm/ 0.125" high	X	
Describe label attachment method and location. <u>Embossed on the top of the master cylinder reservoir cap.</u>		Lettering shall be permanently affixed, engraved or embossed and located so as to be visible by direct view either on or within 100 mm/3.94 inches of the brake fluid reservoir filler plug or cap.	X	
Does the lettering contrast with the background?	<u>Yes</u>	If label is not engraved or embossed, letters shall be of a color that contrasts with the background	NA

Procedure and Example for Determining Master Cylinder Volume Requirement
The procedure followed for determining the minimum volume requirements is outlined in the example shown below. The required data is taken from the previous page. Both measured and manufacturer's provided data utilized to obtain the greatest amount of fluid volume.

Drum Brake:
$$V_r = \frac{2C + \Delta t_l + t_t}{\cos a} A$$

Where: V_r = Volume required per wheel
 C = Manufacturer's recommend radial drum-to-lining clearance
 Δt_l = Change in thickness of Leading lining
 Δt_t = Change in thickness of Trailing lining
 Y = Center point of wheel cylinder to center point of brake

assembly

A = Cross sectional area of the wheel cylinder bore
 NWC = Number of wheel cylinders serviced by the reservoir in

question

$a = \sin^{-1} \frac{2Y}{D}$

D = Cage diameter
 d = Wheel cylinder diameter

Procedure and Calculations for Determining Master Cylinder Volume Requirement, (Contd')

Drum Brake: $V_r = \frac{2C + \Delta t_i + \Delta t_o}{\cos a} A$

$$C = 0.56 \text{ mm} \quad a = \sin^{-1} \frac{2Y}{D} \quad Y = 95.25 \text{ mm} \quad A = \frac{\pi d^2}{4}$$

$$\Delta t_p = 5.23 \text{ mm}$$

$$\Delta t_s = 5.23 \text{ mm} \quad \sin^{-1} \frac{2(95.25)}{248.69} = 49.997^\circ \quad A = \frac{\pi(22.28 \text{ mm})^2}{4} = 389.87 \text{ mm}^2$$

$$V_r = \frac{2(0.28) + 5.28 + 5.28}{\cos 49.162^\circ} (389.87) = 17.299 (389.87)$$

$$V_r = 6744.2 \text{ mm}^3 = 6.74 \text{ ml}$$

Disc Brake: $V_r = (\Delta t_i + t_{ic} + \Delta t_o + t_{oc}) \times \frac{\pi d^2}{4}$

Where: V_r = Volume required per wheel
 Δt = Change in thickness (average)
i = Inboard
o = Outboard
d = Caliper cylinder diameter
C = Average radial drum-to-lining clearance

Disc Brake: $V_r = (\Delta t_i + t_{ic} + \Delta t_o + t_{oc}) \times \frac{\pi d^2}{4}$

$$\Delta t_i = 8.84 \text{ mm}$$

$$\Delta t_o = 8.84 \text{ mm}$$

$$t_{ic} + t_{oc} = 0.4 \text{ mm}$$

$$d = 46 \text{ mm}$$

$$V_r = (8.84 + 0 + 8.84 + 0) \frac{\pi(46.0)^2}{4}$$

$$= 17.68 (1661.9)$$

$$= 29382.4 \text{ mm}^3 = 29.38 \text{ ml (X2 Pistons)} = 58.76 \text{ ml}$$

$$\text{Total Volume required } 2(58.76) + 2(6.74) = 130.9 \text{ ml}^* \quad \checkmark$$

A black and white photograph showing the interior floor of a vehicle. A small, circular electronic device is mounted on a dark, textured floor mat. A thin white wire runs from the device towards the right side of the frame. In the background, a white plastic component, possibly a door sill or part of the seat, is visible. A white rectangular label is placed over the lower right portion of the image, containing text about the vehicle and the date of installation.

APPENDIX C

Contractor's Comments Procedure Modifications and Test Facility

Comments for vehicle C50100.

For all recorded decelerations:

The recorded *average* deceleration values for the tests are slightly lower than that which is required or targeted for certain test sections. However, in all cases and in reality, the driver maintained the correct required/target deceleration values for the majority of time for each of those stops. The recorded deceleration is acquired from the moment the service brake pedal is moved until the vehicle reaches zero speed. Therefore, the time needed to achieve the target deceleration (rise time) and the time the vehicle goes from the target deceleration to zero (fall time) is included in the average deceleration calculation. The rise and fall times were added to the entire length of the stops. Hence the recorded average deceleration values were generally and slightly less than the required/target deceleration values.

For Data Sheets 16 & 22 – Antilock Functional Failure at LLVW and GVWR, respectively, the ABS and the Electronic Brake Distribution (EBD) - Variable Proportioning - are integral. Failing the ABS also fails the EBD. The EBD cannot be failed separately. Therefore, Data Sheets 17 and 23 are not included.

For Data Sheets 20 and 21, the Hydraulic Circuit Failures, the tests were performed in the following order: Data Sheet 21 and 20. This was due to the difficult accessibility of accessing the master cylinder output ports

7.5-MILE TEST TRACK

The 7.5-mile test track encloses a 1,600-acre area, one mile wide and 3.5 miles long.

The track has a downward grade, north to south, of 0.228 percent and a cross slope in the straightaways of 3/16 inch per foot. The 1.88 mile long straightaways flow into transition areas 2,300 feet in length and then into 5,275-foot long curves with a constant radius of 2,400 feet. The 36-foot wide straightaways and the 42-foot wide curves provide three test lanes. Paved berms, 12 feet in width, border the straightaways and the inside of the curves.

As a vehicle moves toward the outside of the track in the curves, it encounters a progressively steeper bank. The inside lane (or "slow" lane) has a bank of 10 degrees allowing a neutral speed of 80 mph with no side forces. In the center lane, the slope increases to 19 degrees resulting in a neutral speed of 110 mph. The outside lane's 28-degree bank allows a 140 mph neutral speed. Rimming the outer lane is a seven-foot safety lane culminating in a 36-degree slope at the guardrail.

The facility is paved with Portland cement concrete. It carries a maximum single axle load of 36,000 pounds and a maximum tandem axle load weight of 48,000 pounds. Special provisions can be made for heavier weight loads.

With 22.5 lane miles, our track will accommodate many vehicles simultaneously. Research which utilizes the track includes component performance and durability studies, brake tests, aerodynamic studies, fuel economy studies, drive line efficiency tests, and the determination of vehicular acceleration and cruise characteristics. In addition, it supports maximum speed determination, road load power, noise and emission measurements and tire durability test programs.

The 7.5-mile test track can be used in conjunction with other facilities at TRC. It provides an excellent area for pre-test conditioning of equipment such as brake burnishing, tire break-in, and vehicle warm-up.

TRC SKID PAD

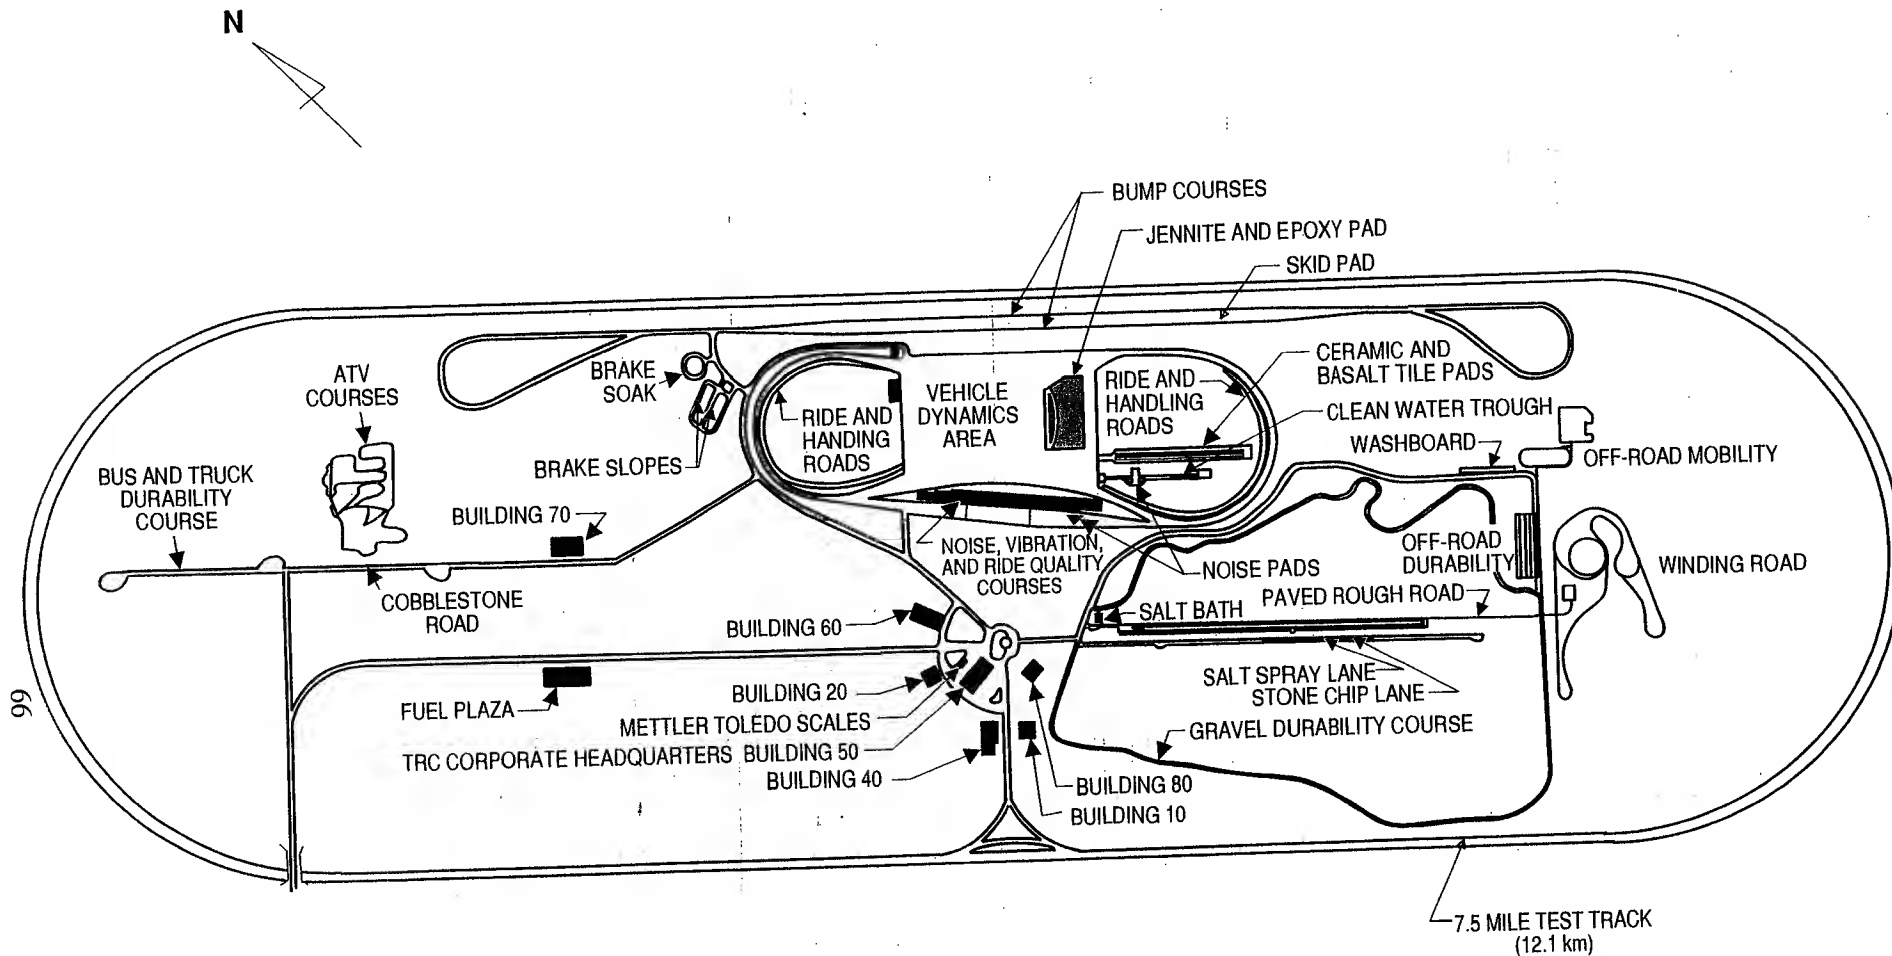

The Skid Pad is a test facility which is utilized primarily for the evaluation of tire and brake systems.

The overall dimensions of the pad are 9,000 feet by 84 feet with loops on the north and south ends. Both turnaround loops have a 309-foot radius and are 16 feet wide with a 25 percent super elevation. They will accommodate speeds of 45 mph with zero side force and 60 mph with .5 g's lateral acceleration. The acceleration/deceleration lanes at each end are 3,280 feet in length.

A test area of 210,000 square feet is situated in the center of the skid pad containing several test pads with varying surface textures. Skid numbers in this area range from 30 (wet) to 80 (dry).

The skid pad is paved with Portland cement. The load capacity of the skid pad is 36,000 pounds maximum single axle weight and 48,000 pounds maximum tandem axle weight.

Varying surface textures in the main test area are ideal for testing tire and/or brake system performance on different surfaces as characterized by "skid numbers." The skid pad is also used for acceleration studies, aerodynamics, rolling resistance, noise testing, and vehicle top speed determination.
